

BUSINESS REQUIREMENTS DOCUMENT (BRD)

Project Name: MindEase (Working Title)

Document Version: 1.0 (MVP)

Deadline 20/6

1. Project Overview

MindEase is an AI-driven mental health companion mobile application designed to support users in understanding and managing their daily emotional well-being. The application emphasizes **intentional mood check-ins** and delivers **structured, time-bound self-care guidance** based on the user's current emotional condition. The system does not provide medical diagnosis or treatment; instead, it focuses on enhancing self-awareness, reducing stress, and identifying early signs of emotional strain in an ethical and accessible manner.

2. Problem Statement

- Limited Emotional Awareness:** Many individuals find it difficult to clearly recognize and interpret their emotional state during periods of stress or anxiety.
- Inconsistent Response to Mental Health Signals:** Users may either neglect emotional warning signs or repeatedly seek reassurance without allowing time for recovery.
- Unstructured Support:** Existing solutions often deliver generalized advice without accounting for emotional variability or recovery duration.

Identified Need: There is a need for a supportive system that enables users to assess their emotional state, receive appropriate guidance, and allow sufficient time for emotional recovery before reassessment.

3. Proposed Solution

MindEase provides an AI-powered mental health companion that:

- Enables users to initiate brief mood assessments at their discretion
- Analyzes responses to determine mood state and severity level
- Delivers guided self-care recommendations with estimated recovery durations
- Introduces a recovery window that temporarily pauses reassessment
- Encourages seeking professional support when negative emotional patterns persist

4. Business Objectives

- Awareness:** Improve users' understanding of their emotional state in a clear and calm manner.
- Support:** Provide practical, non-clinical self-care guidance.
- Trust:** Reduce excessive reassessment and user fatigue through recovery windows.
- Accessibility:** Offer an easy-to-use mental health support tool tailored to students and young adults.
- Scalability:** Establish a foundation that supports future personalization and analytical expansion.

5. Functional and Non-Functional Requirements

5.1 Functional Requirements (MVP)

ID	Requirement Name	Description
FR-1	Mood Check-In	Allows the user to initiate a short questionnaire to assess their current mood.
FR-2	Mood Classification	Classifies the user's mood (e.g., stable, stressed, anxious).
FR-3	Severity Scoring	Assigns a severity level (low, medium, high).
FR-4	Guided Self-Care Actions	Provides 3–5 self-care actions based on mood and severity.
FR-5	Recovery Window	Calculates and enforces a recovery period before reassessment.
FR-6	AI Companion Explanation	Presents results and guidance using clear, human-friendly language.

PR-7	Professional Support Requirement Recommendation	Description
		Professional help when negative patterns persist.

5.2 Non-Functional Requirements

- **Usability:** Simple and intuitive interface; mood assessment completed within two minutes.
- **Performance:** AI responses generated within 5–8 seconds.
- **Privacy:** Secure storage of user data with no third-party data sharing.
- **Ethics:** No medical diagnosis, treatment, or medication recommendations.
- **Language Support:** English for MVP, with Arabic planned for future versions.

6. Project Scope

In Scope (MVP)

- User-initiated mood check-ins
- AI-based mood and severity analysis
- Guided self-care recommendations
- Recovery window enforcement
- Limited mood history (last seven days)

Out of Scope (Future Enhancements)

- Passive or sensor-based mood detection
- Clinical diagnosis or medical evaluation
- Medication recommendations
- Productivity or task management features
- Wearable device integration

7. User Flow Overview

1. User launches the application
2. User selects **"Check how I feel"**
3. User completes a short mood questionnaire
4. AI analyzes mood and severity
5. The system presents guidance and estimated recovery time
6. Reassessment is paused during the recovery window
7. User may reassess after the recovery period or upon explicit request

8. Brand Identity

- **Name:** MindEase (Placeholder)
- **Slogan:** *"Understand your feelings. Take your time."*
- **Brand Concept:** Calm, supportive, and non-judgmental
- **Visual Identity:** Soft color palette, minimal layout, reassuring illustrations

9. Assumptions and Constraints

Assumptions

- Users are willing to provide honest self-reported emotional input.
- Short, intentional interactions are preferred over continuous monitoring.
- AI-generated guidance is perceived as supportive rather than authoritative.

Constraints

- Limited development timeframe
- Dependence on third-party AI APIs for natural language generation.
