

PRODUCT REQUIREMENTS DOCUMENT (PRD)

Product Name: MindEase (Working Name)

Document Version: 1.0 (MVP)

Product Type: AI-Based Mental Health Companion Mobile Application

Deadline 20/6

1. Product Overview

1.1 Product Vision

MindEase aims to provide an AI-powered mental health companion that helps users recognize their current emotional state, receive appropriate self-care guidance, and allow adequate time for emotional recovery. The product is designed to support mental well-being without encouraging over-assessment, clinical diagnosis, or medical treatment.

1.2 Problem Definition

Many individuals face challenges in managing their mental well-being due to:

- Difficulty in accurately understanding their emotional state
- Uncertainty about whether they need rest, self-care, or professional support
- Repeated mood checking without allowing sufficient time for emotional recovery

Most existing solutions either rely on excessive user input, offer generic advice, or blur the boundary between supportive guidance and medical treatment.

2. Target Users

Primary Users

- Young adults aged 18–35, with a primary focus on university students

User Characteristics

- Experience stress, anxiety, mood fluctuations, or attention-related difficulties
- Prefer short, intentional, and meaningful interactions
- Seek guidance and clarity rather than diagnosis or clinical evaluation

3. Product Goals and Success Metrics

3.1 Product Goals

1. Enable intentional and user-controlled mood check-ins
2. Provide clear, actionable, and supportive self-care guidance
3. Prevent excessive usage through time-based recovery windows
4. Promote emotional awareness and healthy self-regulation

3.2 Success Metrics (MVP)

- Percentage of users who complete recommended self-care actions
- Average time between consecutive mood assessments
- Reduction in repeated negative mood reports
- User retention at 7-day and 14-day intervals

4. Core Value Proposition

A mental health companion that helps users understand how they feel in the present moment, guides them toward appropriate next steps, and gives them sufficient time to recover before reassessment.

5. High-Level User Flow

1. User launches the application
 2. User selects **"Check how I feel"**
 3. User completes a short mood questionnaire
 4. System analyzes mood and severity
 5. Application presents:
 - Mood explanation
 - Guided self-care actions
 - Estimated recovery duration
 6. Application enters recovery window mode
 7. Reassessment becomes available after recovery or upon explicit user request
-

6. Functional Requirements (MVP)

6.1 Core Features

FR-1: Mood Check-In

- User initiates a short questionnaire voluntarily
 - Questionnaire completion time does not exceed 2 minutes
-

FR-2: Mood Classification

- The system classifies mood into predefined categories:
 - Stable
 - Stressed
 - Anxious
 - Low mood
 - Overloaded
-

FR-3: Severity Assessment

- Each mood state is assigned a severity level:
 - Low
 - Medium
 - High
-

FR-4: Guided Self-Care Actions

- The system recommends a set of approximately five self-care actions
 - Each action includes:
 - A brief description
 - An estimated time duration
-

FR-5: Recovery Window

- The system calculates an estimated recovery duration
 - During the recovery window:
 - Automatic reassessment is disabled
 - The user is informed to allow time for emotional recovery
-

FR-6: AI Companion Communication

- Results and guidance are explained using clear, human-friendly language
- All communication maintains a supportive and non-medical tone

FR-7: Professional Support Recommendation

- Triggered when:
 - High-severity states persist
 - Negative mood patterns repeat across multiple days
- Recommendations are advisory and non-clinical in nature

7. Personalization Level

Personalization Approach: Slightly Personalized

Inputs Used

- Mood category
- Severity level
- Recent assessment history (last 3–7 check-ins)
- User feedback on suggested actions

Outputs Affected

- Number of suggested actions
- Type of self-care actions
- Duration of the recovery window

⌘ No clinical profiling ⌘ No diagnostic conclusions ⌘ No medication-related advice

8. Non-Functional Requirements

- **Performance:** AI responses must be delivered within an acceptable time frame
- **Usability:** Simple, calm, and minimal user interface
- **Privacy:** Secure data storage with no third-party sharing
- **Ethics:** Clear disclaimers and absence of medical claims
- **Availability:** Android platform for MVP (iOS optional)

9. Out of Scope

- Continuous or passive mood tracking
- Sensor-based data collection (camera, microphone, wearables)
- Productivity or task management features
- Medical diagnosis or treatment
- Emergency or crisis mental health handling

10. AI and Technical Overview

AI Components

- Machine learning models for mood and severity classification
- Rule-based logic for recovery window calculation
- Generative AI for explanation and supportive guidance

Data Sources

- User-provided questionnaire responses
- Aggregated and anonymous historical usage patterns

11. Risks and Mitigation Strategies

Risk	Mitigation Strategy

Users expect medical diagnosis	Clear disclaimers and wording
	Mitigation Strategy
Over-reliance on the application	Encourage professional support
Misinterpretation of AI output	Conservative thresholds and language

12. Development Timeline (1–1.5 Months)

- **Week 1:** Research, UX design, questionnaire formulation
 - **Week 2:** Backend development and ML model implementation
 - **Week 3:** Mobile UI development and AI integration
 - **Week 4:** Recovery logic implementation and testing
 - **Week 5–6:** Refinement, validation, and final demonstration
-
